## Definition of new structures

### Substructures singled out by simple line drawing

Splitting given structure into smaller substructures comes down to drawing dividing lines or new contour and placing corresponding labels. Redefining the shape is equivalent to editing its contour.

### Unrecognized areas

Unrecognized areas in a slide can be attributed to the structures from the upper hierarchy level.

#### **FIGURE 5.**

**Left:** New lines and appropriate labels (blinking) were added to the *contour slide 1*) to show primary somatosensory representation of big facial whiskers ("barrel field", S1BF) in the cerebral cortex (Cx); and 2) to divide ventrobasal complex (VB) into ventral posteromedial (VPM) and ventral posterolateral (VPL) nuclei. Unrecognized thalamic nuclei, which were not labeled with their specific names, are labeled with "Th" so they all will be included in the final reconstruction of the thalamus. **Right:** Updated CAF slide.

- VB - ventrobasal complex
- vBrain - compliment of the whole brain outline
- ZI - zona incerta
